

Introduction

A hacker attack at RSA in 2011 was the trigger to find a way to make such attacks impossible or at least harmless, and led to the invention to be introduced here. It is patented in Germany (ref. 1) and the U.S.A. (ref. 2), and is arbitrarily named “Cyber-save Computing System“, referred to as CySCoS hereafter.

Hardware manufacturers are wanted, who will apply this architecture in the interest of their customers and for their own profitability.
