

How does CySCoS save expenses?

The towering number of malware involving attacks led to an increasing demand of resources in terms of

- Software (purchase, licenses, updates),
- Hardware and
- Manpower

Especially the application of anti-virus-software with its demand of resources leads to the effect, that hardware components have to be exchanged after shorter than expected life cycles, or have to be purchased with large growth potential.

For CySCoS does not require continuous software upgrades, it extends the life span of the systems independent of attackers' activities.

CySCoS may be configured in accordance with the anticipated operational requirements. The ever increasing malware threat does not need consideration. Resources reserved for anti-virus-software are not necessary, and system layout is not any longer influenced by hard to predict hacker activities.
