

## **What is the current development state of CySCoS?**

CySCoS have not been built in hardware yet, for several reasons.

- Lack of hardware related skills on the side of the inventor,
- Very high expenses to order the development of a prototype .

A demonstrator has been produced in software, which illustrates the architecture of CySCoS. It shows the separately stored different categories of data, and proves, that

- only intentionally installed software may be executed, and
- input data cannot be moved to memory areas, which are reserved to contain executable code.
